Documentation: Personal Portfolio Website

1. Project Overview

The Personal Portfolio Website is a static web project developed using **HTML5** and **CSS3**. The website introduces the developer, highlights technical skills, and provides a contact form for communication. The focus of the project is to understand core web development concepts and create a clean, responsive, and visually appealing layout using modern CSS techniques.

---

2. Objectives of the Project

- To learn and apply basic **HTML structure and semantic elements**
- To style web pages using **CSS3**
- To understand and implement **Flexbox and Grid layouts**
- To design a responsive and professional-looking portfolio
- To create a beginner-friendly static website without using JavaScript

---

3. Technologies Used

- **HTML5**: Used for structuring the content of the website
- **CSS3**: Used for styling, layout design, colors, and responsiveness

---

4. Project Structure

The project follows a simple and organized folder structure:

- `index.html` – Contains the main structure and content of the website
- `styles.css` – Contains all the styling rules
- `images/` – Folder containing the profile image
- `README.md` – Project overview and instructions

This separation of structure and styling follows good web development practices.

---

5. Explanation of HTML Concepts Used

5.1 Semantic Elements

The following semantic HTML elements are used to improve readability and accessibility: - `<header>` – Contains the website title and introduction - `<nav>` – Navigation bar with links to different sections - `<main>` – Holds the main content of the website - `<section>` – Divides content into About, Skills, and Contact sections - `<footer>` – Displays copyright information

5.2 Navigation

Anchor tags (`<a>`) are used to create internal links that navigate to different sections using IDs.

5.3 Images

The `<img>` tag is used to display a profile picture with appropriate `alt` text for accessibility.

5.4 Lists

An unordered list (`<ul>`) is used to display technical skills clearly.

5.5 Forms

The contact section uses a form with: - Text input for name - Email input for email address - Textarea for message - Submit button

HTML form validation is applied using the `required` attribute.

---

6. Explanation of CSS Concepts Used

6.1 CSS Reset

A basic reset is applied using the universal selector (`*`) to remove default margins and paddings.

6.2 Layout Techniques

- **Flexbox** is used for:
  - Navigation bar alignment

    - About section content alignment
- **CSS Grid** is used for:
    - Skills section layout
    - Overall main content structure

6.3 Colors and Contrast

- Gradient background is used for a modern look
- High contrast colors ensure readability
- White cards over dark background improve visual clarity

6.4 Responsiveness

Media queries are used to adjust padding, font sizes, and layout for smaller screen sizes.

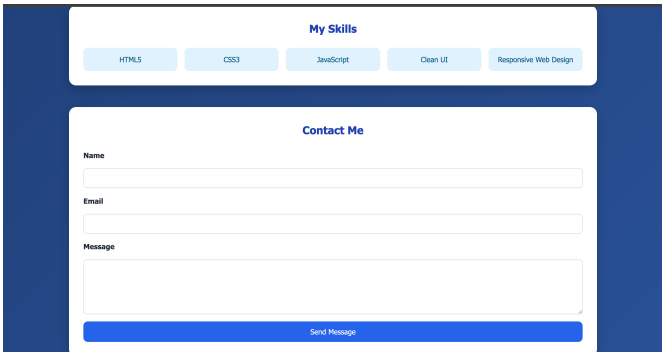
6.5 UI Enhancements

- Border radius for smooth corners
- Box shadows for depth
- Hover effects for navigation links and buttons

---

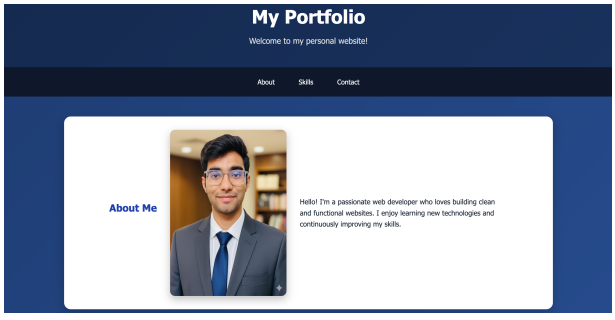
7. How the Project Meets Technical Requirements

- Uses only **HTML and CSS**
- Implements **semantic HTML elements**
- Uses **Flexbox and Grid** for layout
- Fully responsive design
- Clean and readable code structure



Caption

8. Screenshots of the Working Application



---

9. Assumptions Made

- The website is static and does not require backend functionality
- The contact form is for demonstration purposes only
- The project is intended for learning and academic submission

---

10. Conclusion

This project helped in understanding the fundamentals of web development using HTML and CSS. It demonstrates how structured content combined with modern CSS layouts can create a professional and responsive website without using JavaScript or external libraries.
